Progeos Tips Set-Up Cost Savings

Save thousands of dollars when implementing the Progeos System

Often municipalities are charged tens of thousands of dollars to implement GIS software systems. These can include needs assessments for GIS integration, software installations, data support and data conversion. These costs are then compounded by license fees to keep the software running from year to year, and additional support and training costs. At Progeos, the only up-front cost is a small set-up fee. The following describes what a municipality needs to do to use their data with Progeos.

Get online Access to Municipal Data

Many municipalities and counties already have created a variety of GIS and MIS data. This information can include parcel shapefiles, aerial photography in a .tif format or water mains in a .dwg format.

By using Progeos' Cadcorp powered Geognosis GIS server, a municipality does not need to convert any of their data into a specific format. Progeos' software can read over 150 GIS data formats saving a municipality time and money in set-up costs. This capability may also increase the number of layers a municipality can view over their current system, improving flexibility and utility.

Integrate Parcel Information Easily

A municipality sends Progeos its parcel database which is then loaded into the Progeos server and integrated with the municipalities GIS data. Once the data are loaded into the Progeos system, a municipality can use Property Manager to update parcel records over the internet. Progeos can help the municipality format their parcel databases so that the integration with the online system is easy and seamless.

Get Permitting Online Fast

Online permitting is set-up by both the municipality and Progeos. The municipality sends Progeos its permit applications. Progeos converts them into editable PDFs, which are then available to use in the system.

Enforce Code Violations Efficiently

Code Manager users are able to configure their own ordinances and violations data using online tools. Progeos provides a step-by-step process for the municipality to load the data into Code Manager and to customize the system.

Improve Service Request Productivity

When a municipality configures Request Manager they have the ability to update employee, material and work order information through an easy to use online interface. The Progeos system allows users to update their own site, saving consulting fees and improving performance.

Easy to Learn Software

Users have access to web tips, webinars and podcasts through myprogeos.com. This site provides all the support a user needs to get the most out of the Progeos service. For example, if a municipality needs to update employee records in Request Manager they can view the webinar that instructs users on how to complete this task.
